

Sometimes, you want to change the order of the columns to reflect the data in a more intuitive way!

to do so, simply save the df once you have the order you're seeking.

If it started at as

col 1      col 2      col 3

you could update it by saying:

```
df = df[['col 2', 'col 1', 'col 3']]
```

Alternatively, you can save all of the columns as a list, and manipulate it using the list indexes.

For example:

```
cols = list(df.columns.values)
```

```
df = df[cols[0:4] + cols[-1] + cols +  
         [4:12]]
```
